

Battery Equaliser improves battery chemistry - adds years to battery life

Battery Equaliser U.S.A., LLC. has introduced a NEW after-market preventive maintenance product. This liquid additive is the biggest improvement to battery chemistry in 75 years, slower sulfation means longer life, less maintenance and lower operating costs.

As soon as electrolyte is added to a new battery fresh off the assembly line, sulfation begins coating the lead plates. This causes internal resistance that lowers overall performance and, in a few years chokes out all electrical activity.

Battery Equaliser is designed to mix with the battery's electrolyte solution, dissolving existing sulfation and preventing new deposits from forming. Treated batteries will charge faster and hold a charge longer. This can mean up to three times longer storage without finding a dead battery. Sound too good to be true? No wires or screw-ins on

the top of the battery. No switches or timers. Simply top each cell with the recommended amount of Battery Equaliser and let the product work as you

cruise down the road. Batteries can be retreated, every one to two years with as little as a 1/2 oz. per cell or for large house batteries up to 2 oz. per cell. Everyone is looking

for a way to help our environment; here is a way for you to do your part to keep batteries out of the waste stream twice as long and cost much less than a new battery. BATTERY EQUALISER U.S.A., LLC. is the Patent holder and exclusive

blender for this product for the US and Canada.
